

Google Ads API — Basic Access Application

Concept Factory · <https://www.conceptfactory.fr>

Company Name:

Concept Factory

Business Model:

Concept Factory operates a multi-tenant e-commerce platform that we use to launch and manage our own network of custom dropshipping online stores. Each store is fully owned and operated by our company (we do not offer our platform as a public SaaS). Our internal team of site operators ("concepteurs") builds individual storefronts targeting specific product niches across 8 European markets (France, Germany, Belgium, Netherlands, UK, Switzerland, Spain, Italy), each with its own domain name (e.g. www.senior-france.example.com, www.maison-senior.example.de, etc.). All of these stores are owned by our company. We only advertise for stores we own and do not manage Google Ads for any third party or external client.

Tool Access / Use:

Our internal tool is used exclusively by employees of Concept Factory: the Admin (company founder) and authorized site operators. Access is restricted by an email/password authentication system with strict role-based access control — external users have zero access to the Google Ads integration. The tool provides the Admin with: (1) a read-only reporting dashboard showing campaign performance across our owned stores, (2) a Keyword Planner research interface to enrich our internal market research with real Google search volumes, and (3) a centralized view of all accessible customer accounts. The tool does not expose Google Ads data to any external party. We do not generate PDF reports for third parties and we do not share Google Ads data outside our company.

Tool Design:

Our tool is a web application composed of a Python/FastAPI backend connected to a MongoDB database, and a React frontend consumed by authenticated employees. The Admin connects his Google Ads account through the standard OAuth2 Web Flow (including PKCE), and the resulting refresh token is securely stored in the backend database, encrypted at rest. Our backend calls the Google Ads API on demand for two purposes: (a) Keyword Planner research — when an operator needs to estimate search demand for a new product category across our target markets, we call `GenerateKeywordIdeas` and `GenerateKeywordHistoricalMetrics` to obtain real monthly search volumes, competition, and CPC ranges per geo target and language. (b) Campaign reporting — the Admin dashboard uses `GoogleAdsService SearchStream` to pull read-only metrics (impressions, clicks, cost, conversions, CTR, CPC) for the last 7 / 14 / 30 days on our owned accounts. No automated writes to Google Ads are performed at this stage. Rate-limited, human-triggered read queries only.

API Services Called:

- `KeywordPlanIdeaService` — `GenerateKeywordIdeas` (seed keyword → idea list with volume / competition / CPC bounds, per `geo_target_constant` and `language_constant`)
- `KeywordPlanIdeaService` — `GenerateKeywordHistoricalMetrics` (for enriching our internal market analyses with real historical monthly searches)
- `CustomerService` — `ListAccessibleCustomers` (to list the accounts the Admin has authorized access to)

- GoogleAdsService — SearchStream (GAQL) to pull *read-only* campaign-level performance metrics from the *campaign* resource, filtered by segments.date DURING LAST_N_DAYS
- All API calls run at human-triggered cadence (employees clicking a button). No hourly sync or automated batch operations are currently scheduled.

Tool Mockups:

Below are two screenshots of the actual internal tool used by our Admin and operators. All displayed data is from our company's own Google Ads account.

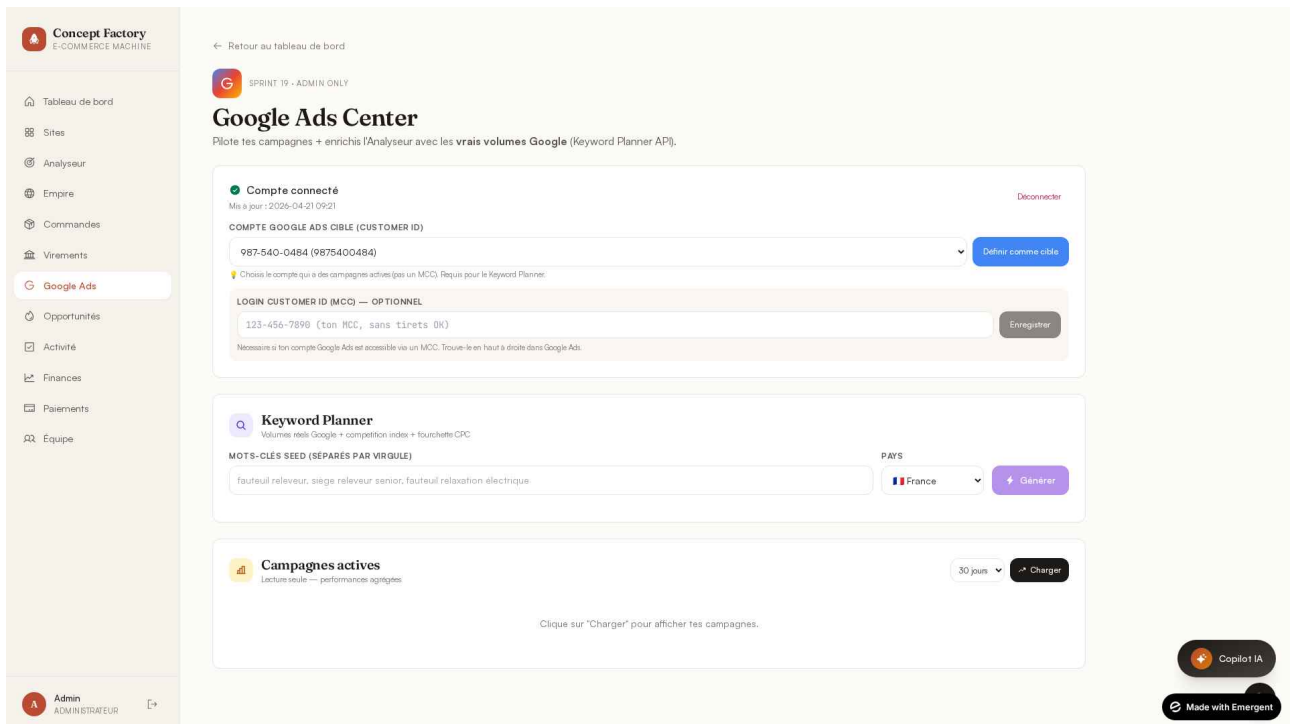

Figure 1 — **Google Ads Center** (Admin-only interface). The Admin connects his Google Ads account via OAuth2, selects the target Customer ID (our owned account), runs Keyword Planner research, and views read-only campaign performance.

Figure 2 — **Market Analyzer**. Our internal tool where operators input a product idea to launch on one of our owned stores. The analyzer queries the Google Ads Keyword Planner API (via the Admin's connected account) to enrich the market research with real monthly search volumes, competition level, and CPC ranges for the selected target countries before we decide to launch a new storefront.
